clark

BETA · FOR MAC

The weekly project report, written from the work itself.

clark is a report editor for programme managers. It keeps the project in one place on your own Mac, and publishes the weekly report as one web page you can send to a client.

Meet clark.

THE PROBLEM

Every week the report is written again, from lists spread over spreadsheets, emails and notes.

THE ANSWER

clark keeps your actions, risks, issues, decisions, milestones and use cases in one place, and the report is written from that work.

What it gives you

Write the report where you read it

Switch between View and Edit, change a status, owner or date in place, and Undo anything.

Keep the log

Actions, risks, issues and decisions, each with an owner, a due date and a history.

Track milestones

On a timeline or a calendar, with a slipped date shown against the agreed one.

Choose what the client sees

Each item and section can be left out of the published page with one click.

Work with Excel

Bring in a workbook you already keep, and export your work items, milestones and use cases back out.

Save on its own, undo any time

Every change saves on its own, and every change can be undone.

Ask about your project, or change an item in words

ask clark answers questions about the project and can check the report, using the Claude or ChatGPT you connect in Settings. It reads the project's data and suggests changes. Nothing is saved until you press Apply, and Undo takes a change back.

Sneak peek: with a work item open in Edit, type "move to Friday, owner Jo, high priority", see each field before and after, and press Enter. Undo takes it back.

How it works

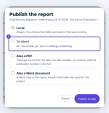

1 Keep the log

Add work items by hand with the + buttons, or bring them in from Excel.

2 Choose what the client sees

Leave out any item or section you do not want on the published page.

3 Publish as one web page

It opens anywhere, with no server and no sign-in.

Private by design

Your data stays on your computer. It goes only where you send it: a published report, an Excel or Word file you save, a backup folder you choose, or, when you ask clark a question, the passages it needs go to the Claude or ChatGPT you connected.

- **Runs on your Mac** — Nothing to host.
- **Sent when you ask** — Off in Settings.
- **No sign-in for clark itself** — Sign-in is to the one you connect.
- **No server** — One file to publish.

Get clark

Unzip the download: you get one folder called clark. Open it and double-click clark.command.

WHAT IT NEEDS

A Mac and **Google Chrome**, with Python 3.9 or newer. To check your Mac is ready, open Terminal in the clark folder and type **bash clark.command --check**.

Beta: it works and is tested, but expect rough edges. Windows and Linux downloads come later.

All pictures show made-up demo data.
